What is the Internet of Things?

- Connecting any device with an on and off switch to the Internet (and/or to each other)
  - Examples: cell phones, coffee makers, washing machines, headphones, lamps, wearable devices, and almost anything else you can think of
  - This also applies to components of machines, for example a jet engine of an airplane or the drill of an oil rig

Gartner predicts that by 2020 there will be over 26 billion connected devices

The IoT is a giant network of connected “things” (which also includes people).

Scenario

- You are on your way to a meeting
  - Your car accesses your calendar and already knows the best route to take
  - If traffic is heavy, your car might send a text to the other party notifying them that you will be late

Potential Impact of IoT

- Your alarm clock wakes up you at 6 am and then notifies your coffee maker to start brewing coffee for you
- Your office equipment knew when it was running low on supplies and automatically re-ordered more
- The wearable device you use in the workplace tells you when and where you were most active and productive and shares that information with other devices that you used while working
