Data Exploration and Visualization

Agenda

- High Level Process
- Graphing in R: Core and Lattice
- ggplot2 introduction
- Extended Titanic Exploration
- Visualization in Azure

Agenda

- High Level Process
- Graphing in R: Core and Lattice
- ggplot2 introduction
- Extended Titanic Exploration
- Visualization in Azure

Learning Guidance

- Focus on the ideas rather than exact syntax
- R help is your friend
- I will share output samples on the slides often
- Sample code + slides: Data Exploration and Visualization folder

Data > Algorithm

- More data == better performance
 - Even with a simple algorithm
- But there are caveats
 - Diminishing returns
 - High quality and high variety needed
 - Algorithm must be appropriate
 - Feature selection/engineering

Understand Your Data!

- Not spending time on data is a common source of all sorts of problems!
- Are any features correlated with each other?
- What is the scale of your numeric features?
- Are there clear groups of data objects?
- Do you have missing values and where?

And More!

Agenda

- High Level Process
- Graphing in R: Core and Lattice
- ggplot2 introduction
- Extended Titanic Exploration
- Visualization in Azure

Sidebar: Formula data type

- Built in R type
- Defines relationships between named columns

```
data(iris)
head(iris)

f.1 <- Species ~ .
f.2 <- ~ Species + Petal.Width
f.3 <- ~ Petal.Length | Species

class(f.1)</pre>
```

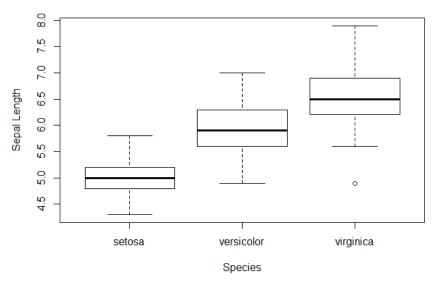

Core: Box

- Distribution of single feature
- Can partition by target class

```
boxplot(Sepal.Length ~ Species,
data=iris,
main="Sepal Length for Various
Species",
xlab="Species",
ylab="Sepal Length"
)
```

Sepal Length for Various Species

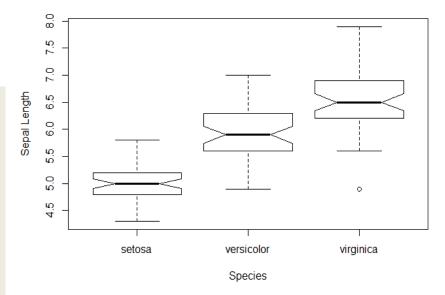

Core: Box with Notches

- Estimate of confidence interval of the median
- Notch overlap indicates confidence that median is different

```
boxplot(Sepal.Length ~ Species,
data=iris,
main="Sepal Length for Various
Species",
xlab="Species",
ylab="Sepal Length",
notch=TRUE
)
```

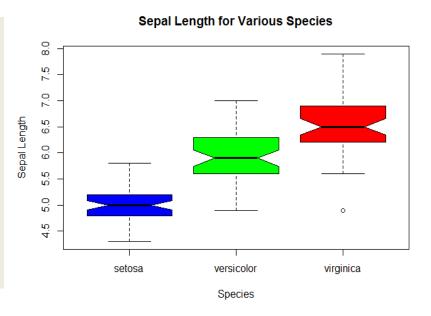

Sepal Length for Various Species

Sidebar: Coloring Core Plots

```
boxplot(Sepal.Length ~ Species,
data=iris,
main="Sepal Length for Various
Species",
xlab="Species",
ylab="Sepal Length",
notch=TRUE,
col=c("blue","green","red")
)
```

Sidebar: Saving Plots

Function	Output to			
pdf("mygraph.pdf")	pdf file			
win.metafile("mygraph.wmf")	windows metafile			
png("mygraph.png")	png file			
jpeg("mygraph.jpg")	jpeg file			
bmp("mygraph.bmp")	bmp file			
postscript("mygraph.ps")	postscript file			

```
pdf("myplot.pdf")

boxplot(Sepal.Length ~ Species,
data=iris,
main="Sepal Length for Various Species",
xlab= "Species", ylab="Sepal Length",
notch=TRUE, col=c("blue", "green", "red")
)

dev.off() # Returns plot to the IDE
```

Windows Saves to default: Libraries\Documents

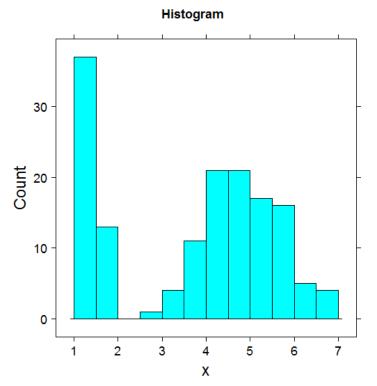

R Studio makes it easier

Lattice: Histogram

- Spread of single feature
- Places values in "bins"
- "breaks" # of bins

```
histogram(iris$Petal.Le
ngth, breaks=10,
type="count",
main="Histogram")
```

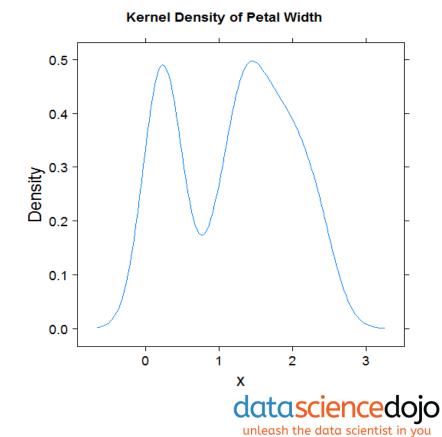

Lattice: Density plots

- Variant of Histogram
- Scaled for easy comparisons

```
densityplot(iris$Sepal.Width,
main="Kernel Density of Petal
Width", type="percent",
n=150)
```

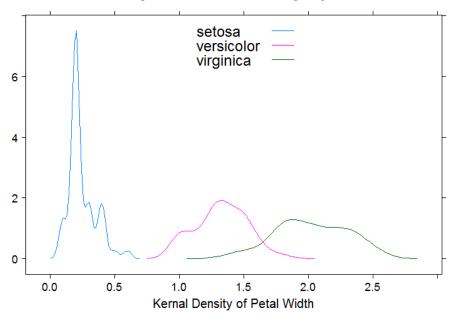

Lattice: Multiple Density Plots

- Grouping simple
- Styling is not!

```
densityplot (~ Petal.Width,
data=iris, groups=Species,
plot.points=F,
xlab=list(label="Kernel Density
of Petal Width", fontsize=20),
ylab="",
main=list(label="Density of
Petal Width by Species",
fontsize=24),
auto.key=list(corner=c(0,0),
x=0.4, y=0.8, cex=2),
scales=list(cex=1.5))
```

Density of Petal Width by Species

Exercise 1

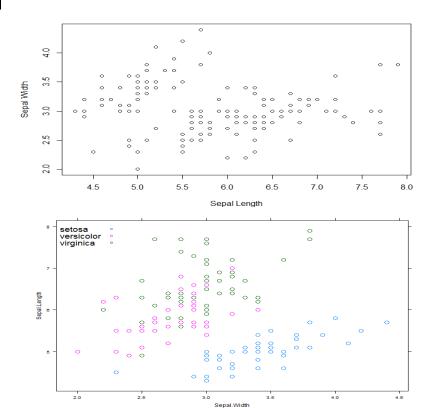

- 2-D Scatter plots plot() and xyplot()
 - Sepal Length vs Sepal Width
 - Petal Length vs Petal Width
 - Color based on Species (lattice)

Sample Solution

```
# Core Graphics
plot(iris$Sepal.Length,
iris$Sepal.Width, xlab="Sepal
Length", ylab="Sepal Width")
```

```
# Lattice Graphics
xyplot(Sepal.Length ~
Sepal.Width, data=iris,
groups=Species,
auto.key=list(corner=c(0,0),
x=0, y=0.85, cex=1.5), cex=1.5,
scales=list(cex=1.5))
```

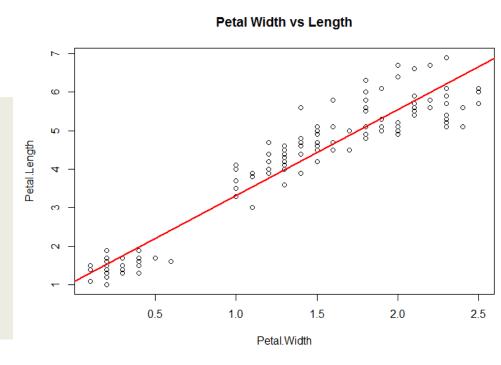

Core: Extended Scatter Plots

Add a regression line

```
plot(Petal.Length ~
Petal.Width, data=iris,
main="Petal Width vs
Length")

abline(lm(Petal.Length ~
Petal.Width, data=iris),
col="red", lwd=2)
```

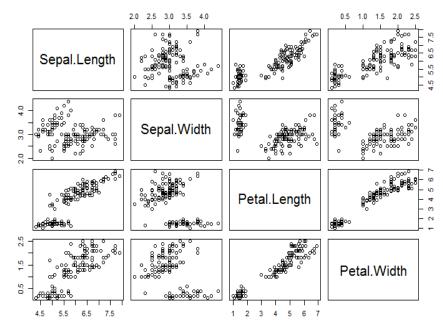

Core: Scatter Plot Matrix

- Multiple relationships on one graph
- Good for initial explorations

```
pairs(~ Sepal.Length +
Sepal.Width + Petal.Length +
Petal.Width, data=iris,
main="Simple Scatter Matrix")
```

Simple Scatter Matrix

Lattice: Scatter Plot Matrix

Simple Grouping

```
# Getting settings for legend
super.sym <-
trellis.par.get("superpose.symbol")

splom(iris[1:4],
groups=iris$Species,
panel=panel.superpose,
key=list(title="Three Flower Types",
columns=3,
points=list(pch=super.sym$pch[1:3],
col=super.sym$col[1:3]),
text=list(c("Setosa","Versicolor","Verginic
a"))))</pre>
```

Three Flower Types Scatter Plot Matrix

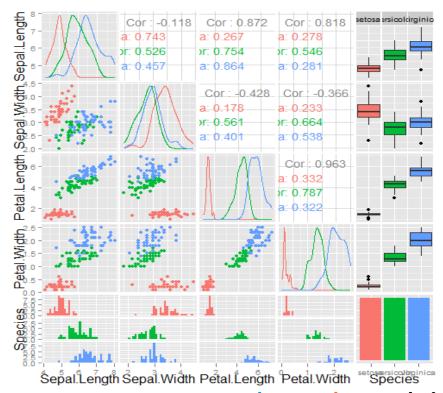

Enhanced Scatter Plot Matrices

```
library(GGally)

ggpairs(iris, color="Species")
```

Many packages have custom pairs implementations

Exercise 2

- Load "mtcars" dataset: data(mtcars)
 - ?mtcars for details
- Goal: Predict MPG based on other columns
- Create at least 2 different plots illustrating useful relationships in the data

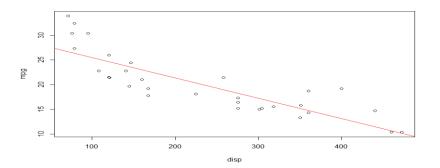

Sample Solution 2

```
densityplot( ~ mpg, data=mtcars,
groups=cyl, plot.points=F,
auto.key=list(columns=3, title="Cylinders")
```

```

```

Cylinders

```
plot(mpg ~ disp, data=mtcars)
abline(lm(mpg ~ disp, data=mtcars),
col="red")
```

Agenda

- High Level Process
- Graphing in R: Core and Lattice
- ggplot2 introduction
- Extended Titanic Exploration
- Visualization in Azure

Lattice/Core styling is a pain!

- ggplot2 syntax easier to read/write
 - Less intuitive/steeper initial learning curve
 - More power than often needed

ggplot Basics

- ggplot() is the basic function
- geom_*() creates a graph layer
- aes() defines an "aesthetic" either globally or by layer

Loading

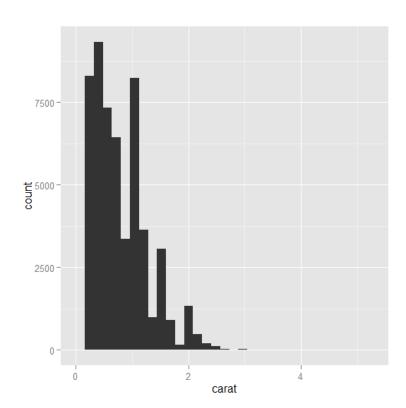

library(ggplot2) data(diamonds) head(diamonds)

> head(diamonds)

	carat	cut	color	clarity	depth	table	price	x	У	z
1	0.23	Ideal	E	SI2	61.5	55	326	3.95	3.98	2.43
2	0.21	Premium	E	SI1	59.8	61	326	3.89	3.84	2.31
3	0.23	Good	E	VS1	56.9	65	327	4.05	4.07	2.31
4	0.29	Premium	I	VS2	62.4	58	334	4.20	4.23	2.63
5	0.31	Good	J	SI2	63.3	58	335	4.34	4.35	2.75
6	0.24	Very Good	J	VVS2	62.8	57	336	3.94	3.96	2.48

Histogram

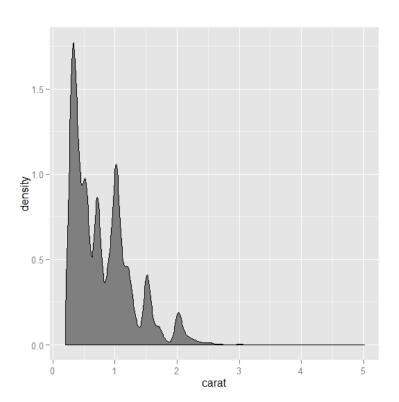

ggplot(diamonds, aes(x=carat)) +
geom_histogram()

Density plot

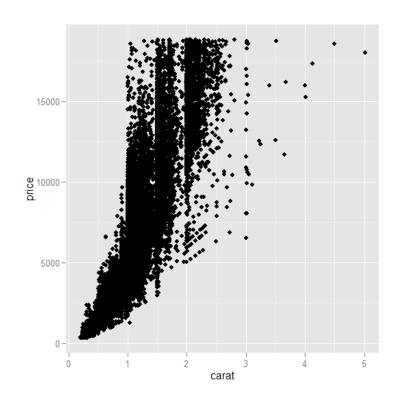

ggplot(diamonds) +
geom_density(aes(x=carat),
fill="gray50")

Scatter plots

ggplot(diamonds, aes(x=carat, y=price))
+ geom_point()

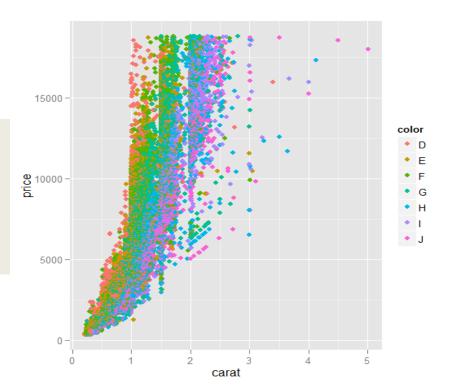

ggplot Object

Store the plot for future modification g <- ggplot(diamonds, aes(x=carat, y=price))

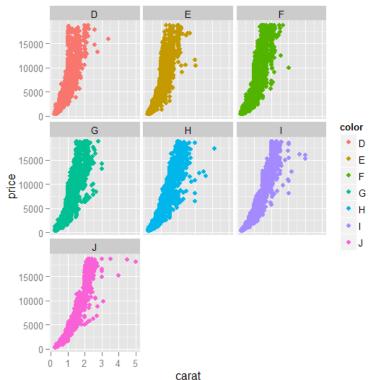

add settings specific to geom_point layer
g + geom_point(aes(color=color))

Segment by factor attribute

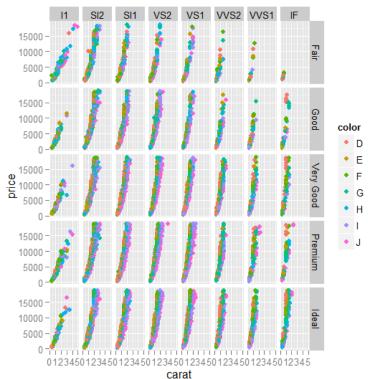

g + geom_point(aes(color=color)) + facet_wrap(~ color)

More Segments!

g + geom_point(aes(color=color)) + facet_wrap(cut ~ clarity)

Practicing ggplot

- Documentation at <u>http://docs.ggplot2.org/current/</u>
- Lists all the different geom_* and other functions, with what aes() settings they use

Agenda

- High Level Process
- Graphing in R: Core and Lattice
- ggplot2 introduction
- Extended Titanic Exploration
- Visualization in Azure

Finding the Code

- Set your working directory to the bootcamp root
- Load data in from "Datasets/titanic.csv"

Looking at the first few rows

```
titanic <- read.csv("Datasets/titanic.csv")
head(titanic)</pre>
```

```
        head(titanic)

```

Casting & Human Readability

Set target column as a factor

```
titanic$Survived <- as.factor(titanic$Survived)</pre>
```

Rename factors and columns

```
'data.frame': 891 obs. of 2 variables:
$ Embarked: Factor w/ 4 levels "Unknown", "Cherbourg",...: 4 2 4 4 4 3 4 ...
$ Survived: Factor w/ 2 levels "0", "1": 1 2 2 2 1 1 1 1 2 2 ...
```

Class distribution: Pie Chart

```
survivedTable <- table(titanic$Survived)
par(mar=c(0, 0, 0, 0), oma=c(0, 0, 0, 0),
cex=1.5)
pie(survivedTable, labels=c("Died", "Survived"))</pre>
```

Is Sex a Good predictor?

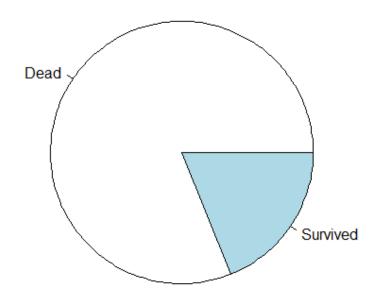

```
male <- titanic[titanic$Sex=="male",]
female <- titanic[titanic$Sex=="female",]
par(mfrow=c(1,2))
pie(table(male$Survived), labels=c("Dead","Survived"),
main="Survival Portion of Men")
pie(table(female$Survive), labels=c("Dead","Survived"),
main="Survival Portion of Women")</pre>
```

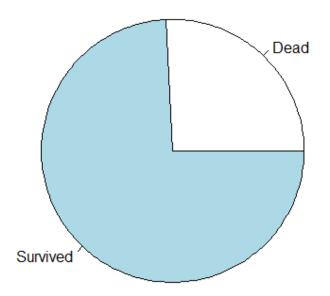

Is Sex a Good predictor?

Survival Proportion Among Men

Survival Proportion Among Women

Is Age a Good Predictor?

summary(titanic\$Age)

```
Min. 1st Qu. Median Mean 3rd Qu. Max. NA's 0.42 20.12 28.00 29.70 38.00 80.00 177
```

How about by survival?

```
summary(titanic[titanic$Survived=="Dead",]$Age)
summary(titanic[titanic$Survived=="Survived",]$Age)
```

Min.	1st Qu.	Median	Mean	3rd Qu.	Max.	NA's
1.00	21.00	28.00	30.63	39.00	74.00	125
Min.	1st Qu.	Median	Mean	3rd Qu.	Max.	NA's
0.42	19.00	28.00	28.34	36.00	80.00	52

Exercise 3

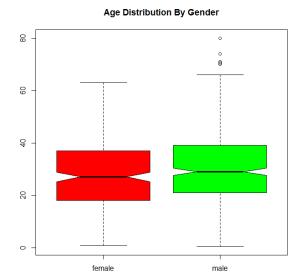

- Create 2 box plots of Age
 - Segmented by Gender
 - Segmented by Survived
- Create a histogram of Age
- Create a density plot of Age
 - na.omit() may be useful

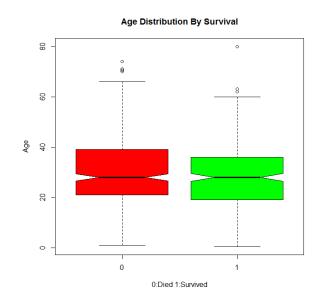

Sample Solution 3

boxplot(Age ~ Sex, data=titanic,
main="Age Distribution By Gender",
col=c("red","green"), notch=T)

boxplot(Age ~ Survived, data=titanic,
main="Age Distribution By Survival",
col=c("red","green"), notch=T, ylab="Age")

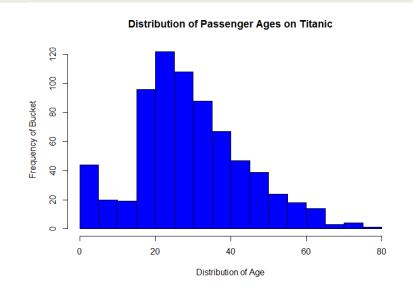

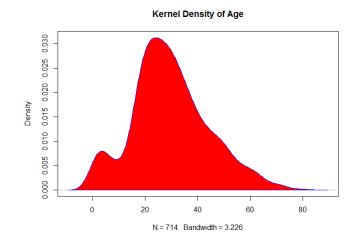

Sample Solution 3

hist(titanic\$Age, col="blue", breaks=12, xlab="Distribution of Age", ylab="Frequency of Bucket", main="Distribution of Passenger Ages on Titanic")

density(titanic\$Age) #NAs prevent this
d <- density(na.omit(titanic\$Age))
plot(d, main="Kernel Density of Age")
polygon(d, col="red", border="blue")</pre>

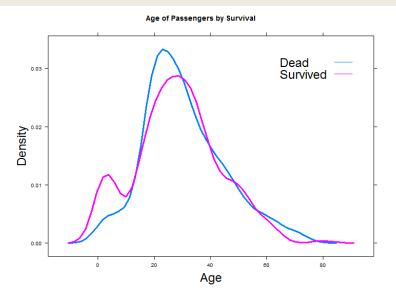

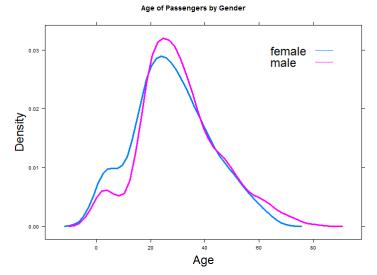

Is Age a Good Predictor?

densityplot(~ Age, data=titanic,
groups=Sex, plot.points=F, lwd=3,
auto.key=list(corner=c(0,0), x=0.7, y=0.8))

densityplot(~ Age, data=titanic, groups=Survived, plot.points=F, lwd=3, auto.key=list(corner=c(0,0), x=0.7, y=0.8))

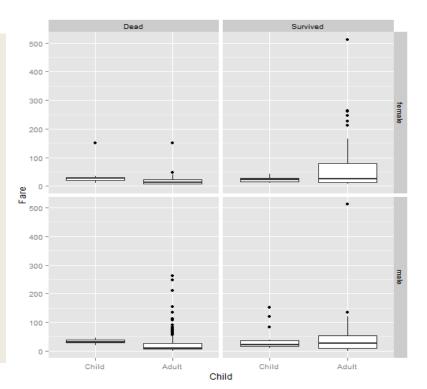

Exercise 4

- Create a new column "Child"
 - Assign each row "Adult" or "Child" based on a consistent metric
- Use ggplot to create a series of box plots relating Fare, Child, Sex, and Survived

Sample Solution 4

```
child <- titanic$Age
child[child < 13] <- 0
child[child >= 13] <- 1
titanic$Child <- as.factor(child)
levels(titanic$Child)
levels(titanic$Child) <- c("Child", "Adult")</pre>
g <- ggplot(data=titanic[!is.na(titanic$Child),],
            aes(x=Child, y=Fare))
g.b <- g + geom boxplot()
g.b + facet grid(Sex ~ Survived)
```

Agenda

- High Level Process
- Graphing in R: Core and Lattice
- ggplot2 introduction
- Extended Titanic Exploration
- Visualization in Azure
